

# Tip Tap Games.

## Doomscroll — except you're the one playing.

A vertical, swipe-through feed that looks and feels exactly like TikTok or Reels — but every card is a playable mini game instead of a video. Stay on a game as long as you're enjoying it. Bored? Swipe. A completely different game is already running. Endless.

Mobile-first · AI-tool friendly

### The Insight

Short-form feeds won on one mechanic: **zero decisions before the dopamine**. No menus, no picking, no loading — and the swipe is the only control you need. Mobile gaming still makes you choose a game, download it, sit through a tutorial and watch an ad. Tip Tap Games takes the feed mechanic and swaps passive content for active play.

**The pitch in one line:** the same thumb, the same trance, the same infinite scroll — but the user is *doing* something instead of watching something.

### Core Loop

01

#### Land

Game is already live and playable. No tap-to-start, no menu, no tutorial.

02

#### Play

As long as you like. One mechanic, endless rounds, score climbing.

03

#### Compete

Your score hits a live leaderboard the moment the round ends.

04

#### Swipe

Bored? Next game, different mechanic, zero load. The feed never ends.

The swipe is the exit — not a timer. A winning player can sit on one game for twenty minutes; a bored one is a single flick from something new.

### What The User Actually Sees

- **Full-bleed vertical card**, one game per screen, snap scrolling.
- **Right rail** — mimics the social UI: high score, leaderboard, like, share, creator handle.
- **Bottom-left overlay** — game title, one-line rule ("Tap when the bar hits green").
- **Top** — live score and personal best, nothing else.
- **No home screen.** The app opens directly into the feed.
- **No tutorials.** The rule is one sentence, on screen, always.
- **No loading.** The next card mounts while the current one is being played.
- **No forced exit.** Nothing ever pulls a player off a game they're enjoying.

### Reference Mini Games — Starting Points Only

- **Perfect Timing** — tap when the sweeping bar enters the green zone. It speeds up every round.
- **Tap Rush** — hit targets before they vanish; miss three and the run ends.
- **Color Trap** — tap only the word whose colour matches its meaning.
- **Hold & Release** — fill the bar to the target without overshooting.
- **Memory Flash** — tiles flash, repeat the order, the sequence keeps growing.
- **Dodge** — drag a dot through falling blocks and survive as long as you can.

**Invent your own — that's the real brief.** These six exist so nobody stalls at a blank page; they are not the assignment. The best builds will ship mechanics nobody in the room has seen. Four rules only: one mechanic, understandable in two seconds, one thumb, endless.

## ■ Definition of Done — 12 Hour MVP

If every row is true and it runs in a phone browser, the build ships. Nothing else counts.

| REQUIREMENT                     | PASSES WHEN...                                                                                                             |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| ✓ <b>Vertical snap feed</b>     | Swiping up or down moves exactly one full-screen card, with momentum snap. Touch and mouse-wheel both work.                |
| ✓ <b>3+ playable games</b>      | Three genuinely different mechanics. Each is endless or round-based — the player decides when to stop, never a timer.      |
| ✓ <b>Auto start / auto stop</b> | A game starts when its card is on screen and hard-stops the moment it leaves. No zombie timers, no stacked audio.          |
| ✓ <b>Guest play, then login</b> | Anyone can play and score with zero sign-up. Google or Discord login is offered only when there's a score worth keeping.   |
| ✓ <b>Persisted scores</b>       | Runs are written to a real database, not local state. Personal best survives a refresh and a device change once signed in. |
| ✓ <b>Live leaderboard</b>       | Per-game board with real player handles and the user's own rank, readable without leaving the card.                        |
| ✓ <b>Endless feed</b>           | Games recycle or shuffle forever. The user can never hit the bottom.                                                       |
| ✓ <b>Deployed public URL</b>    | Judges open it on their own phone from a link or QR code. Localhost is a fail.                                             |

## ■ Identity & Login — Earn It, Don't Demand It

A leaderboard needs real accounts, but the feed must never open on a login wall. Play first, sign in second — at the exact moment a score becomes worth keeping.

- **Google or Discord OAuth only.** No email, no password, no forms.
- **Guest by default** — a device ID in local storage tracks runs from the first swipe.
- **Trigger at the win:** "You're #7 — sign in to claim it."
- **Merge on sign-in.** Every guest score is reattached to the new account. Nobody loses a run.
- **Bottom sheet, not a page.** Login happens over the card; nobody leaves the feed.
- **Discord is the community play** — that's where these players live, and handle and avatar come free.

## ■ The Data — Three Tables Is Enough

- **players** — id, handle, avatar\_url, provider (google | discord), device\_id
- **scores** — id, player\_id, game\_slug, score, created\_at
- **games** — slug, title, rule\_text, is\_active
- **Everything else is derived.** Leaderboard = top N per game. Rank = higher scores + 1. Percentile = runs below yours. Best = max per player per game.
- **Guard the writes.** Cap or validate scores server-side — a board the room can cheat kills the demo.

## ■ Community Hooks — Ship At Least Two

- **Per-game leaderboard** — top 10 plus your own rank, live on the card.
- **"You beat 74% of players"** after every run — social proof without needing friends.
- **Ghost rival** — the exact score needed to pass the player above you.
- **Challenge link** — share a game with your score attached; they land on that card.
- **Daily board** — a today-only reset so newcomers aren't facing an unbeatable record.
- **Friend feed** — filter the board to people you signed in alongside.

## ■ Traps To Avoid

- **A login wall.** Auth never blocks the first swipe.
- **A games library** instead of a feed. The feed *is* the product.
- **Deep games.** If it needs a tutorial, it's wrong.
- **Leaderboards behind a menu.** If they must navigate, they won't.
- **Rolling your own auth.** Use a hosted provider.
- **Desktop-first layout.** Design at 390×844.
