

Vibe Coder Passports.

Ship monthly. Collect stamps. Prove it.

A public showcase of work that is actually *shipped* — live, open, usable by a stranger — wrapped in a passport that proves you keep doing it. Apply, get approved, get a numbered passport. Post one shipped project a month and earn a month stamp plus a stamp for the industry you shipped into. Anyone can rate any project, and every month one builder takes a cash prize.

12h live-stream sprint

Web app · any stack

Showcase first · passport on top

Cash prize each month

The Insight & The End Goal

AI made building easy, which quietly destroyed building as a signal. Everybody has a repo, a demo video and a half-finished landing page; almost nobody has a link a stranger can open and use. That gap is the product.

The end goal: one point of truth for what vibe coders around the world are actually capable of. Today that proof is scattered across dead threads, private Discords and repos nobody opens. This becomes the single link you send when someone asks what you can do, and the first place the world looks to find people who ship.

The Foundation Is The Showcase

Build the gallery first — voting, stamps and the prize are layers on top of a wall of real, working projects. Filter by category and month, nothing more. If a visitor closes the tab having seen nothing worth clicking, no leaderboard saves it.

- **A grid of shipped projects** — screenshot, name, one line, category, builder, month, score.
- **Every card opens the real thing** in a new tab. The live link is the point.
- **The showcase is permanent.** Old months stay browsable forever — the archive of the scene.
- **Every project links to a passport, every passport links back to its projects.** That loop is the whole site.

What Counts As Shipped — The Bar

- **A live public URL that loads.** Not a repo, not a Figma, not a video, not localhost.
- **Open to anyone.** No invite code, no waitlist, no "email me for access."
- **The core action works** without the builder in the room. A stranger can do the main thing themselves.
- **One line of plain language** saying what it does, under 100 characters.
- **One screenshot** — captured from the URL automatically if none is uploaded.
- **One category** from the fixed list below. This is what mints the stamp.

The check should run itself — nobody sits there reviewing submissions. When a builder hits submit, the server visits the URL, confirms it loads and grabs the screenshot on its own. Dead link, and the project bounces back marked "*not shipped yet*" instead of quietly appearing in the showcase. Roughly twenty minutes of work, and it's what keeps the bar real without anyone policing it.

The Ten Categories

AI & Agents · Dev Tools · Games · Social · Productivity · Fintech · Health · Commerce · Creative · Education. Fixed, never free-text — a closed list keeps stamps collectable and the data honest.

Two Kinds Of Stamps

- **Month stamps — the habit.** One per month shipped. The streak is visible; a missed month leaves a permanent gap.
- **Category stamps — the range.** Ship an AI tool, earn the AI stamp; a game next month earns Games. Repeats level up: AI I → AI II → AI III.
- **Titles from the mix** — Specialist (3 in one), Explorer (3 different), Polymath (6 different).
- **Tiers by volume** — Tourist (1), Frequent Flyer (3), Resident (6), Citizen (12).
- **The passport shows** number, flag, both stamp types, streak, tier and every project.

The Month Is The Unit

01

Apply

One short application. Approved builders get a numbered passport.

02

Ship

One project a month, one only. It has to clear the bar or it doesn't count.

03

Rate

Anyone can score any project. No account, one rating per person per project.

04

Stamp

Month closes, board freezes. Everyone who shipped is stamped, one takes the prize.

The prize. One builder is crowned Vibe Coder of the Month and takes a cash prize, funded by **DollarVibeClub** (planned — not live at the hackathon). The stamp is the credential, the showcase is the proof, the prize is the headline.

The Voting Model — Every Project Gets A Score

Anyone can rate any project, no account required. The score lives on the card permanently — part of that project's record, not just this month's contest.

- **One tap, one to five.** The shorter the interaction, the more ratings you collect. One rating per project per device, rate-limited.
- **Rank on a weighted average with a minimum vote count.** Three perfect scores must never outrank two hundred votes averaging 4.6.
- **Engineer exposure.** A "needs votes" rail surfacing the least-rated projects, so nothing dies unseen.

Optional layer — category duels. Two projects from the same category side by side: "which of these two AI tools would you rather use?" Faster to play, and it can crown a Category Champion. The trade-off: ratings give every project a permanent score but reward whoever brings the most friends; duels don't. **Start with ratings; add duels if the clock allows.**

The Map — Your Call

Show where builders are and let someone tap through to their work. How it looks is deliberately unspecified — a flat map, a spinning 3D globe, a 3D world you fly through. The one part of this brief with no prescribed answer.

Definition of Done — 12 Hour MVP

REQUIREMENT	PASSES WHEN...
✓ Apply & approve	Application form, an approve/reject list, and a public count of who's waiting.
✓ Submit & shipped check	One per builder per month. Server loads the URL, screenshots it, rejects dead links.
✓ The showcase	A public grid — screenshot, one-liner, category, builder, score. Cards open the live product.
✓ Passport page	Number, flag, stamps, streak, projects. The link previews as the passport when posted.
✓ Rating	Anyone rates any project without logging in. Scores feed a weighted ranking.
✓ Standings & close	A live month board, and a close that writes stamps and crowns the winner, on demand.
✓ The map	Builders shown by location, tappable through to their work. Any visual approach.
✓ Deployed public URL	Judges apply, submit and rate from their own phones. Localhost is a fail.

Out Of Scope & Data

- **Don't build:** comments, follows, DMs, notifications, email.
- Payments in-app — the prize is announced, paid by hand.
- A real admin dashboard — one approve/reject list will do.
- **builders** — id, handle, avatar_url, provider, passport_no, country
- **projects** — id, builder_id, season, name, tagline, url, image_url, category
- **ratings** — id, project_id, score, voter_key, created_at
- **Derived:** weighted score, rank, stamps, streak, tier. GitHub or Google to hold a passport.

The rule: if it isn't one of the eight rows above, it isn't in the twelve hours. Behind at hour eight, simplify the map and approve by hand in the database — but never cut the shipped check or the showcase.
